

Secure Profile Management

Enterprise Security and Identity Management for IP-based Systems

LiteScape Secure Profile Management™ unifies an organization's identity management systems with IP telephony to provide secure authentication and personalization through an IP phone.

With Secure Profile Management's patent-pending technology, users get **secure, policy-based and personalized** access to communication applications, extension mobility and device presence management, directories (corporate, personal, public) and vertical-specific applications and information. SPM's patent-pending technology supports leading encryption, security and authentication standards and protocols to leverage existing identity management systems

Benefits

- **Increase Security** – links an organization's identity management system with its telephony infrastructure to provide secure authentication and policy enforcement through an IP phone.
- **Personalized Access** – enables users to receive personalized access to their communications applications and data, such as corporate directory, on any IP phone within their network.
- **Secure Mobility** – secures extension mobility throughout a global enterprise regardless of the number and type of PBXs deployed in that organization. SPM guarantees that users get access to only authorized applications.
- **Maximize IT Investment** – by taking traditionally distinct and separate technologies (identity management systems and PBXs) and make them work efficiently together to maximize IT utilization and security.

Certifications

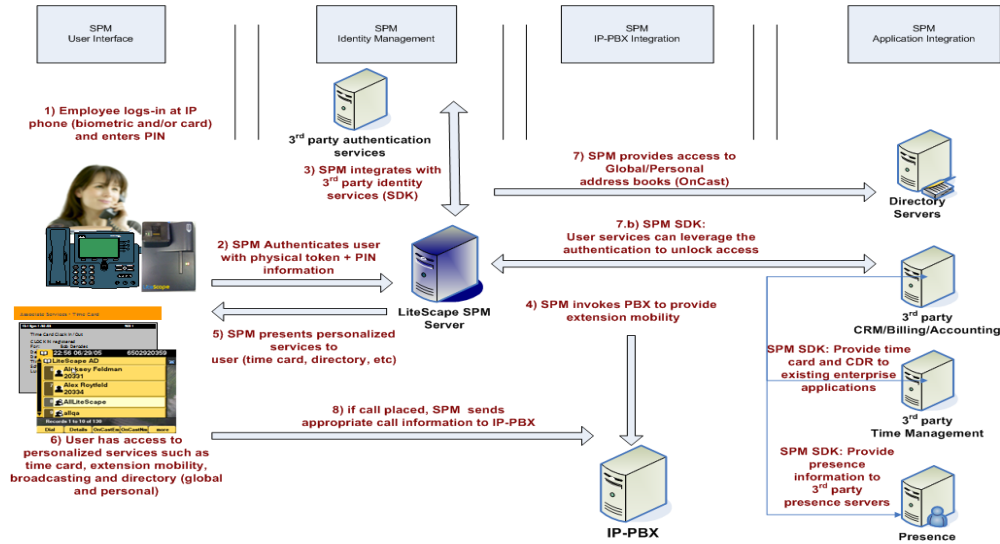

- US DoD Approved Product (JITC IA)
- FIPS 140-2 (Federal Information Processing Standard)

Use Case

- *A major US government agency uses SPM with SPAR devices so users get **secure access** to their information from any IP phone worldwide.*
- *A large high-end retailer in Japan uses the RFID solution so customers can **check inventory** from the fitting room.*
- *Time card clock **abuses were eliminated** using multiple authentication—password and biometrics—at this US grocer.*
- *Customers of this financial institution can log-in at this inexpensive kiosk for **secure transactions** or to contact their personal representatives.*
- *This national call center uses **session and device presence** to track users and transfer information.*

The level of security provided by multi-factor identification enables users to provide a combination of different types of identification: who they “are” such as their fingerprint (Biometrics), what they “have” like an ID card, and finally what they “know” like a password.

When combined with any 3rd party ID reader, SPM enables multi-factor identification and authorization through an IP phone. Security is increased by authenticating users in multiple ways from one device. SPM Captures this information, validates it against information in an organization’s identity management system and then grants the user their appropriate level of access.

LiteScope offers its own patent-pending, multi factor ID device, **Secure Personal Authentication Reader (SPAR)™**—one device can include barcode, RFID, magnetic cards, and biometric reader. Used as a ‘side-car’ to any IP phone, SPAR enables secure and encrypted exchange of authentication information at the edge of an IP network.

- Hardware Requirements—Processor: 2 GHz, dual processor, Memory: 3 GB RAM, Hard Disk Space: 40 GB available
- Software Requirements—Windows Server 2003 Standard SP2 or higher, Microsoft IIS 6.0, Microsoft .NET framework, Microsoft SQL Server 2005 Standard
- Supported directory servers—Microsoft Active Directory, LDAP, Microsoft Exchange, Custom database
- Supported IP Telephony Systems—Cisco CallManager 3.x, 4.x, 5.x, 6.x, or 7.x
